```
cprogram> → <stmt*>
<stmt> → <varDec> | <funcDec> | <if-stmt> | <while-stmt> | <expr> | <returnstmt>
<varDec> → "let" Identifier ":" type "=" expression";"
<funcDec> → "function" Identifier "(" parameterList ")" ":" type "{" statement* "}"
\langle if\text{-stmt} \rangle \rightarrow "if" "(" expression ")" statement ("else" statement)?
\langle while\text{-statement}\rangle \rightarrow "while" "(" expression ")" statement
<expr-stmt> → expression";"
<return-stmt> → "return" expression?
<expr> → <literal> | <Id> | <bin-expr> | <unary-expr> | <func-call>
teral> → <number> | <string> | <Boolean>
<bin-expr> → <expr> <binaryOperator> <expr>
<unary-expr> → <unaryOperator> <expr>
\langle func-call \rangle \rightarrow \langle Id \rangle "(" argumentList ")"
<param-list> → (Identifier ":" type ("," Identifier ":" type)*)?
\langle arg-list \rangle \rightarrow (expression ("," expression)*)?
```

١

```
<type> → "number" | "string" | "boolean" | "void"

<binaryOperator> → "+" | "-" | "*" | "/" | "==" | "!="

<unaryOperator> → "-" | "!"

. (unaryOperator> → "-" | "!"

. (unaryOperator) لطفاً توجه داشته باشید که این گرامر بسیار ساده است و تنها برخی از ویژگیهای اصلی TypeScript را پوشش می دهد.
```
